

QA Internship Assignment

Submitted by: Sushmita Subedi

Tool Used: Playwright

Language: JavaScript

Date: July 2026

1. Objective

The objective of this project was to automate the **Agency Partner Signup** workflow using Playwright. The automation covers the complete registration process, including account creation, agency details, experience details, business information, document upload, and payment details.

The purpose of this automation is to reduce manual testing effort, improve test repeatability, and verify that the signup process works as expected.

2. Technologies Used

Technology	Purpose
Playwright	Browser automation
JavaScript	Test scripting
Node.js	Runtime environment
Visual Studio Code	Code editor

3. Test Scenario

The automated test performs the following actions:

1. Open the Authorized Partner website.
2. Navigate to the Login page.
3. Open the Signup page.
4. Accept the Terms and Conditions.
5. Enter user account information.
6. Verify the email using OTP.
7. Enter agency information.

8. Enter experience details.
9. Enter business and certification details.
10. Upload required documents.
11. Submit the registration form.
12. Open the Profile page.
13. Add payment details.
14. Verify that the profile page is displayed successfully.

4. Test Data

The following test data was used during automation.

Field	Value
First Name	Sushmita
Last Name	Subedi
Email	Generated dynamically using Date.now()
Phone Number	Generated dynamically
Password	Password7\$#
Agency Name	Leadahead Consultancy
Branch	New Baneshwor
Bank	Laxmi Sunrise Bank

5. Automation Approach

To prevent duplicate account errors, the automation generates a unique email address and phone number for every execution.

Example:

```
const email = `sushmita${Date.now()}@gmail.com`;
```

```
const phone = `98-${Math.floor(10000000 + Math.random() * 90000000)}`;
```

This allows the signup test to be executed multiple times without encountering "**Email already exists**" or "**Phone number already exists**" validation errors.

6. Challenges Faced

During implementation, several issues were encountered:

Duplicate Email

Using a fixed email address caused the application to display "**Email already exists**".

Solution

Generated a unique email address for every execution.

Duplicate Phone Number

Using the same phone number repeatedly caused validation errors.

Solution

Generated a random phone number for each test execution.

OTP Verification

The application requires email verification using a One-Time Password (OTP).

The OTP is sent to the registered email address.

Since no test API or OTP bypass mechanism was available, this step could not be fully automated.

A temporary pause was added to allow manual OTP entry during testing.

Locator Issues

Some elements initially caused timeout and strict mode errors because the locators matched multiple elements.

These issues were resolved by using more specific Playwright locators such as:

- `getByRole()`
- `locator()`
- Accessible names

7. Limitations

The only remaining manual step is the OTP verification process.

The application sends the OTP to an external email account, and no API or test endpoint was available to retrieve it programmatically.

Therefore, complete end-to-end automation could not be achieved without additional support from the application.

8. Result

The Playwright automation successfully performs:

- Opening the application
- Navigation
- User registration
- Form validation
- Agency information entry
- Experience information entry
- Business details entry
- File upload
- Payment details entry

The only manual intervention required is OTP verification due to the application's external email authentication process.

9. Conclusion

The signup workflow was successfully automated using Playwright.

The script demonstrates the use of modern Playwright locators, reusable test data, and dynamic email and phone number generation to avoid duplicate account issues.

Although OTP verification remains a manual step due to application limitations, the remaining workflow is fully automated and can be reused for future regression testing.
